

Design Review Critique	How we addressed it
Unable to run setup.exe	Fixed it
Can't run on any other OS besides Windows	That's the intention, noted in README
some of the variable names and method names were not explicit enough and didn't capture their purpose	Renamed them
users should have the ability to record keystrokes using their keyboard rather than manually selecting them through a dropdown menu.	Time didn't allow the addition of another functionality
ensure that exceptions and any other errors are handled	Added
You have two menus that add buttons to two different button layouts. From the menu I clicked on "Open Application Lists. Here you have another button layout opening where you can add and remove the buttons. It looks to me like you have completely duplicated the code here, because the "Add Button" option on the main menu doesn't allow for spaces in the file path (like "Program Files") and in the Open Application Lists layout the "+" button does add them. They have different add button forms which are totally different.	Those are two different cases, work has been done to make it more apparent. However, some features are shared across both layouts: both cases enable an app to be loaded via drag and dropping a file, tooltips are added for each feature on both menus.
The ability to select multiple keys for a hot key is a necessity	Added
There is a bug in the control to keep the focus from moving away from your current window when you press a hot key that makes it so that when you have your program on the second screen and you have focus on another program it sometimes doesn't allow you to use the hot key, and then it breaks completely	Clarified so that the window MUST have focus in order to use these hotkeys. Also adjusted so that it'll be easier for the window to take focus when we want it to.

**Additional Changes After Code Review:**

- Work done to save grid layouts so that when the user closes the program, their buttons will still be there when they restart it.
- Application is able to boot on start-up, or not, based on user preference.
- Tooltips are added to make navigation easier
- As intended, Open Application Lists now opens most applications onto the Zenbook Pro Duo's secondary monitor (called ScreenPad Plus)
